Radius Dashboard

- Problem: Radius concepts need to be visualized
 - Solution: Ship a dashboard as a part of Radius distro
- Problem: GUI work is specialized and often duplicative
 - Solution: Build using Backstage to leverage framework and libraries
- Problem: Users are happy with their existing dashboards
 - Solution: Implement as plugins for extensibility and customization

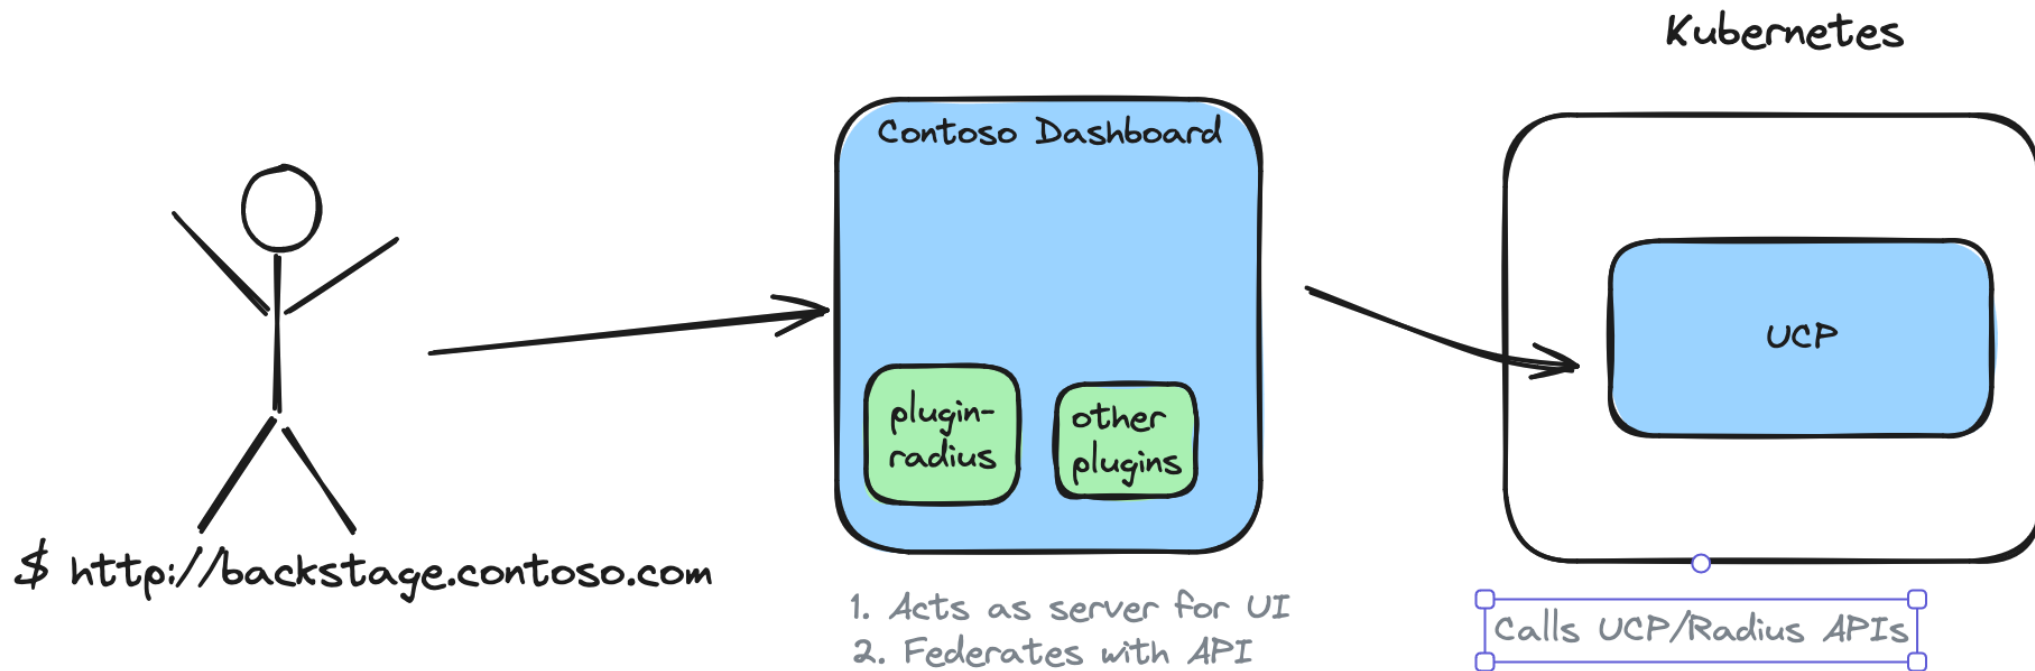

DEMO

Radius Dashboard

Architecture and Design: Dashboard in Radius

Architecture and Design: User-hosted Backstage

Architecture and Design: Technology & Packages

- Typescript/TSX
- Backstage:
 - app: frontend UI (React)
 - backend: backend (NodeJS)
- Plugins:
 - plugin-<name> (React)
 - plugin-<name>-backend (NodeJS)
 - Backend is optional
 - Plugins get compiled-into app or backend
- rad-components contains AppGraph visualization
 - Pure react, no dependency on Backstage
 - We will reuse this in other places like GitHub Copilot integration

Good, Bad, and Not-sure

- Good

- Easy to get started: project creation, theming, plugins.
- Easy to add to our existing architecture and call existing API

- Bad

- Container size. Took a lot of work to get to ~950mb (minimal plugins)
- Dashboard is included in Radius install and increases install time moderately
- Could shrink install size with two-phase build but ended up fighting with JS build system.

- Not-sure

- Started building integration between app-graph and catalog.
- Not sure if it's a good idea.

Future Work

- Improvements to application graph UI
- Integration between application graph and software catalog
- Build additional plugins to expose other Radius features, e.g. recipes management, resource modifications, etc.
- Interop with other plugins to enrich existing dashboard experiences
